An issued record preserves submitted information. It is not a grade or proof of comprehension.

Personal GitHub repository URL

https://github.com/Kon-6/CS-110-GameProject

Git test: edit run/preview save commit push open remote. Record the test commit and result.

I created my repository by logging into GitHub and clicking on New Repository. I gave my repository a name and created it. after that, I opened my repository in GitHub Codespaces so could work on my files. I used index.html to create and edit my webpage. I saved my changes, committed them, and pushed them to GitHub so my work would be saved in repository.

Instructor access and team Git readiness: what did you test? Solo: say solo.

Solo

1 Introduction scan notes, one useful idea and one question

The video introduces the game development process using Unity. I learned that creating a game involves different steps, including planning, designing, programming, and testing. I want to learn more about how Unity works and how C# is used to make games.

2 Developer mindset scan notes, one useful idea and one question

The video explains why having a good mindset is important in game development. I learned developers need to be creative, patient, and willing to learn from their mistakes. It also talks about challenges like technical problems, adding too many features, and burnout. One thing I found useful was setting small goals and staying organized instead of trying to do everything at once, I think this can help me as I continue learning programming.

3 Folders and project creation scan notes, one useful idea and one question

I learned that organizing your folders and files is important when creating a game because it makes everything easier to find. The video showed how to create a main project folder and use different folders to keep things organized. One thing i found useful was the dolog.txt file because it helps you keep track of your progress. My question is, do we need to create all these folders manually, or can we use a tool to create them automatically.

4 Documentation scan notes, one useful idea and one question

I learned that documentation is important when creating a game because it helps keep everything organized and makes it easier to understand the project. The video showed how a Game Development can be used to the game's features, goals, and progress. One thing i found useful was using README files to explain what each folder contains. My question is, do we need to create a Game Development Document even if we are working on a small game by ourselves?

5 Introduction to Unity scan notes, one useful idea and one question

I learned how to get started with Unity and how to create a new game project using Unity Hub. The video showed the different parts of the Unity Editor, like the Hierarchy, Scene View, Game View, and Inspector. One thing I found useful was learning how to test a game using the Play button and move the character with WASD. My question is, can I use

the Third Person Core template to create my own game instead of starting completely from scratch?

6 Import a custom player scan notes, one useful idea and one question

The video shows how to import a custom player into Unity instead of using the default character. I learned that you can customize your game by adding different character models and organizing their files in your project. One thing I found useful was seeing how the character can be changed to make the game more unique. My question is, can I use any 3D character model in Unity, or does it need to be compatible with the game?

Your interpretation: what can this pipeline contribute to a prior or new story?

I think this game development pipeline can help me create my own game by showing me how to plan and organize everything before starting. For my project, I want to make a simple 3D game where the player moves around and collects coins. The videos helped me understand how to set up a Unity project, organize files, and customize characters. I think following these steps will make it easier to build my game and fix problems along the way.

Questions to resolve before committing to a team or mission

Before starting my project, I want to know what the easiest way to create a simple game in Unity is. I also want to know how to organize my files, test my game, and upload everything to GitHub. Since I m still learning, I want to keep my game simple and focus on making sure it works.

Whiteboard

This is my plan for creating a simple 3D obstacle course game in Unity. I will start by creating the project, then add a player, platform, and obstacles. After that, I will test the game to make sure the player can move and jump. Finally, I will save my project to GitHub. I am working on this project by myself, and my goal is to keep everything simple and organized.
