Personal public verification code: VIEW-50209D39587C8ADAB63D3341

Include your own public code with every assignment, even in a team folder. Never submit your private recovery key.

SHA-256: 68350fbb6d70cd727356a7ea42e46a95371f2a43fd12e6f15ba205632987fe53

Verify the record number at courses.addp2p.com/development-road/independence/index.html?view=verify

An issued record preserves submitted information. It is not a grade or proof of comprehension.

What did you personally execute? Connect completed tasks to files/commits.

For this assignment, I created a RollABall project in Unity on my MacBook. I organized my project files and used VS Code to create a .gitignore file so unnecessary Unity files would not be uploaded to GitHub. I had some trouble getting the .gitignore file to work correctly, but I made changes and reduced the number of files showing in GitHub Desktop.

I then committed my Unity project and pushed it to my CS-110-GameProject GitHub repository. I checked GitHub and confirmed that my RollABall folder and project files were uploaded successfully.

Record setup/import checks, project opens/runs, player configuration/result, and one failure fix retest. Separate observed results from predictions.

I created my RollABall project in Unity on my MacBook and checked that the project folders, including Assets, Packages, and ProjectSettings, were saved. I also worked with VS Code and GitHub Desktop to organize and upload my project.

One problem I encountered was that GitHub Desktop initially showed 351 changed files, including unnecessary Unity files. To fix this, I created and updated a .gitignore file to exclude temporary files, build files, and other unnecessary folders.

After making these changes, I checked GitHub Desktop again and the number of changed files decreased to 159. I then committed and pushed my project to GitHub. I verified that the RollABall folder appeared in my online repository.

I confirmed that my project files were uploaded successfully. I still need to confirm the game s Play Mode behavior and player movement in Unity.

Personal GitHub URL/commit, team link if used, project/source paths, PDFs, boards/images, credits and reproduction instructions.

I uploaded my Unity RollABall project to my personal GitHub repository so my instructor can access my work.

GitHub Repository:

https://github.com/Kon-6/CS-110-GameProject

Project Location:

CS-110-GameProject/RollABall

CS110 / INDEPENDENCE ROAD

Source Files:
RollABall/Assets

Unity Settings:
RollABall/ProjectSettings

My GitHub commit is titled Added Unity RollABall game project.

To open my project, download or clone my GitHub repository, open Unity Hub, select Add Project from Disk, and choose the RollABall folder. Open the project using a compatible Unity Editor version, then open the game scene from the Assets folder.

I completed this project individually, so I do not have a separate team repository. I have not included any separate PDFs or boards as evidence. My project files and GitHub commit provide evidence of my work. I used Unity, VS Code, and GitHub Desktop to create and organize the project.

Compare the result with the mission. What did you verify, what remains, and what should the team do next?

For this mission, my goal was to create a Unity game project and upload it to GitHub. I successfully created my RollABall project and pushed the files to my GitHub repository.

I verified that my project files were uploaded correctly by checking my GitHub repository. One important thing I learned was how to use a .gitignore file to prevent unnecessary Unity files from being uploaded. This helped reduce the number of changed files and made my project easier to manage.

The main thing that remains is fully testing the game in Unity to make sure the player moves correctly and the game runs without errors.

My next step is to test the player controls, fix any problems, and improve the gameplay. Since I worked individually, I will continue developing and testing the project myself.

Whiteboard

My diagram shows how I created, tested, and fixed my Unity RollABall game. I built a platform, a player-controlled ball, five collectible coins, and a score counter. I tested the game and confirmed that the ball moved using WASD, the coins disappeared when collected, and the game displayed YOU WIN! after collecting all five coins.

CS110 / INDEPENDENCE ROAD

One problem happened when I moved my Unity project folder to my Desktop. My saved scene was not showing when I opened Unity. I fixed this by reconnecting the project through Unity Hub and opening my saved SampleScene. I tested the game again and confirmed that it worked.

I learned that keeping project files organized and opening the correct project location is important. I also uploaded my project to GitHub so my work could be accessed later.

Execution / result

reviewedPlan

mission

I chose to create a simple 3D Roll-a-Ball game using Unity. The player will control a ball using the keyboard and move it around a platform. My goal is to make a basic playable game that works correctly.

framework

I decided to use the ADD/P2P framework to help organize my project. I will start by planning my simple 3D Roll-a-Ball game, then build it step by step in Unity. I will test the ball movement, fix any problems, and make sure the game works before submitting it.

pipeline

Make a 3D Roll-a-Ball game 2026-11-10T12:45 to 2026-11-10T13:45 Pacific

Unity, sphere, platform, C# 2026-11-10T13:45 to 2026-11-10T14:45 Pacific

Create objects and ball movement 2026-11-10T14:45 to 2026-11-10T15:45 Pacific

Playable 3D game 2026-11-10T15:45 to 2026-11-10T16:45 Pacific

Test controls and fix errors

My production plan is to create a simple 3D Roll-a-Ball game in Unity. First, I will create a platform and a sphere. Next, I will add a C# script to control the ball using the keyboard. Finally, I will test the game, fix any errors, and make sure the ball moves correctly. I will complete all tasks myself.

tech

I decided to use Unity 6 to create my 3D Roll-a-Ball game because it has the tools needed to build a simple 3D game. I will use C# to program the ball s movement and Visual Studio Code to write and edit my scripts. I will use basic Unity objects like a sphere and a cube for the ball and platform, so I won t need extra assets or packages. I will also use GitHub to save my project. Since I am working alone, I will check everything myself by testing the game and making

sure the controls work correctly.

I will work independently and complete my 3D Roll-a-Ball game in Unity. | Kevin Contreras / GitHub | [x]

reuse

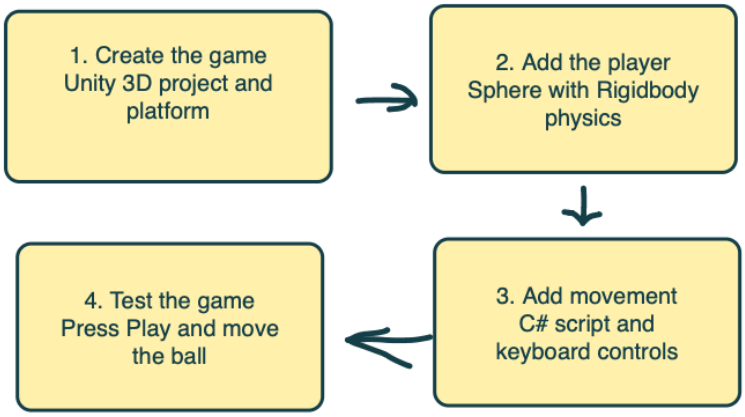

I can reuse the player movement script, camera controls, and basic game objects in future Unity projects. These will help me create other simple 3D games faster. I will use Unity s built-in tools and my own code. If I use outside assets or code, I will check their licenses and give credit when required.

boardNotes

I decided to create a simple 3D Roll-a-Ball game using Unity and C#. My plan is to make a ball that moves around a platform using keyboard controls. I will work alone and use GitHub to save my progress. My main question is how to make the movement and camera work correctly. I will test the game in Unity and fix any problems I find. There are no team disagreements because I am working solo.

Whiteboard

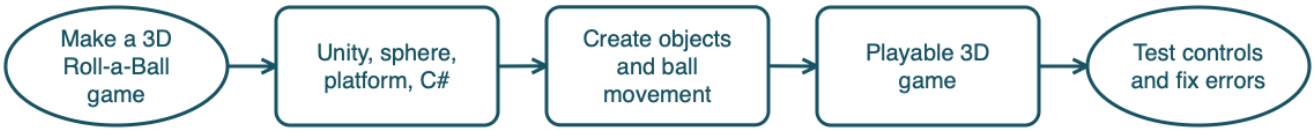

I am working solo on a simple 3D Roll-a-Ball game. My plan is to create a platform, add a ball as the player, write a C# movement script, and test the controls in Unity. I will be responsible for all tasks. My goal is to make a playable game where the ball moves using the keyboard.

notes

Since I am working solo, I reviewed my project plan myself. My goal is to create a playable 3D Roll-a-Ball game in Unity. I will be responsible for setting up the game, adding player movement, testing it, and uploading my progress to GitHub. My next step is to begin building the game. I may need help with Unity and C# coding, but I will test each part as I go.

recap

I understand that my goal is to create a simple 3D Roll-a-Ball game using Unity. Since I am working alone, I will be responsible for setting up the project, creating the platform and ball, adding player movement, testing the game, and uploading my progress to GitHub. My next step is to start building the game and make sure the ball moves correctly using the keyboard. I may need help understanding some of the Unity controls and C# code.
